## Acronyms List

---

AAR	after action review(s)
ACM	Alaska Compliance Manual
API RP 13C	American Petroleum Institute standard physical testing of shaker screens
BMP	Best Management Practice
BOP	blow out preventer
CFR	Code of Federal Regulations
DEC	(Alaska) Department of Environmental Conservation
DMR	Discharge Monitoring Report
DWOP	“drill (the) well on paper”
ECM	Environmental Compliance Manual
ESV	environmentally sensitive valve
EPA	US Environmental Protection Agency
GSSL	General Seawater Service Line
HSE	health, safety and environment
ISPS	International Ship and Port Security
LGS	low gravity solids
LO/TO	lock out/tag out isolation method
LWI	local work instruction
m <sup>3</sup>	meters cubed which is equal to 264.2 gallons
MARPOL	International Convention for the Prevention of Pollution from Ships
MARSEC	Maritime Security
MODU	Mobile Offshore Drilling Unit
MSD	marine sanitation device
MSDS	Material Safety Data Sheets
NOI	Notice of Intent
NPDES	National Pollution Discharge Elimination System

## Acronyms List (Continued)

NPDES GP	General Permit for the authorization to discharge under the NPDES Oil and Gas Exploration Facilities on the Outer Continental Shelf (AKG-28-8100)
OCS	Outer Continental Shelf
OD	outer diameter
OSR	oil spill response
OSRP	Oil Spill Response Plan
OWS	oil water separator
PMI	preventative maintenance instructions
POB	persons/individuals on-board
<i>Polar Pioneer</i>	MODU Polar Pioneer
PPE	personal protective equipment
PTW	permit(s) to work
QAPP	Quality Assurance Project Plan
RMO	Rig Manager's office
SCE	solids control equipment
SDS	Safety Data Sheets
Shell	Shell Gulf of Mexico, Inc.
SOPs	standard operating procedures
SPP	solid particulate phase
TAH	total aromatic hydrocarbons
TAqH	total aqueous hydrocarbons
Transocean	Transocean Offshore Deepwater Drilling
WBM	water based mud
WMP	Waste Management Plan, waste minimization practices

**Best Management Plan – Permit by Reference Table**

<b>Permit Cite</b>	<b>Permit Special Conditions: Best Management Practices Plan Requirements</b>	<b>Plan Section</b>
Page 18 II.A.12.c.	The calculations of maximum concentrations must be based on the amount of chemical additives added to the volume of the waste stream discharged. The permittee must include the chemical additive implementation procedures, calculation methods, record keeping and reporting procedures in the BMP Plan.	Drilling Fluids Plan, LWI in Appendix D, Documentation & Recordkeeping –Section 11
Page 50 II.N.3.	Best Management Practices for All Facilities. New facilities that do not meet the threshold requirements regarding the amount of water withdrawn or percentage of water withdrawn for cooling water purposes in subsection N.1. above, and existing facilities, are required to implement best management practices to minimize the impingement mortality and entrainment of all life stages of fish and shellfish in accordance with the Best Management Practices Plan requirements, Section IV.B.5. New facilities that meet the threshold requirements are also are required to implement the Best Management Practices Plan requirements, Section IV.B.5., in addition to the other Cooling Water Intake Structure Requirements in Attachment 3 of this general permit.	<b>Non-Applicable</b>  Cooling Water Intake Structure – Section 9.1
Page 56 IV.B.1.	The permittee must develop and implement a BMP Plan which achieves the objectives and specific requirements listed below. The permittee must operate the exploratory facility in accordance with its current BMP Plan or in accordance with subsequent amendments to the BMP Plan. The permittee must ensure that the BMP Plan incorporates practices to achieve the objectives and specific requirements listed below. The BMP Plan must be submitted with the Notice of Intent (NOI).	BMP Plan Development and Implementation - Section 2
IV.B.2.	The permittee must certify and notify the Director in writing that the BMP Plan is on-site at least 7 days prior to any authorized discharge under this general permit. The certification must identify the NPDES permit number and be signed in accordance with the Signatory Requirements of Section VI.E.	Certification Statement – Section 2.3
IV.B.3	Through implementation of the BMP Plan, the permittee must:	Discharge Management- Section 4.3
	<ul style="list-style-type: none"> <li>a. Prevent or minimize the generation and the potential for the release of pollutants from the exploratory facility to the waters of the United States through normal operations and ancillary activities; and</li> <li>b. Ensure that methods of pollution prevention, control, and treatment will be applied to all wastes and other substances discharged.</li> </ul>	Regulated Discharges- Section 7

### Best Management Plan – Permit by Reference Table

Permit Cite	Permit Special Conditions: Best Management Practices Plan Requirements	Plan Section
IV.B.4 Page 56-57	The permittee must develop and amend the BMP Plan consistent with the following objectives for the control of pollutants.	Discharge Management – Section 4.1
	a. The number and quantity of pollutants and the toxicity of effluent generated, discharged or potentially discharged at the exploratory facility must be minimized by the permittee to the extent feasible by managing each waste stream in the most appropriate manner.	
	b. Under the BMP Plan, and any Standard Operating Procedures included in the BMP Plan, the permittee must ensure proper operation and maintenance of the exploratory facility.	Fluids Management – Section 6, Operating Practices – Section 7
	c. The permittee must establish specific objectives for the control of pollutants by conducting the following evaluations.	Preventive Maintenance and Operation – Section 9
	1. Each facility component or system must be examined for its waste minimization opportunities and its potential for causing a release of significant amounts of pollutants to waters of the United States due to equipment failure, improper operation, and natural phenomena such as rain or snowfall, etc. The examination must include all normal operations and ancillary activities including loading or unloading operations or spillage or leaks.	
	2. Where experience indicates a reasonable potential for equipment failure, natural condition (e.g., precipitation), or other circumstances to result in significant amounts of pollutants reaching surface waters, the Plan should include a prediction of the direction, rate of flow and total quantity of pollutants which could be discharged from the facility as a result of each condition or circumstance.	Equipment Failure and Repair – Section 10
IV.B 5. Page 57	The BMP Plan must be consistent with the objectives listed above and the general guidance contained in the publication entitled Guidance Manual for Developing Best Management Practices (BMPs) (USEPA, EPA 833-B-93-004, 1993) or any subsequent revisions to the guidance document. The BMP Plan must:  a. Be written in narrative form and must include any necessary plot plans, drawings or maps, and must be developed in accordance with good engineering practices. The BMP Plan must be organized and written with the following structure:	BMP Plan, Appendices, and Referenced Documents – Section 13

### Best Management Plan – Permit by Reference Table

<b>Permit Cite</b>	<b>Permit Special Conditions: Best Management Practices Plan Requirements</b>	<b>Plan Section</b>
IV.B.5.  Page 57-58	1. Name and location of the facility.	Exploration Program - Section 1
	2. Statement of BMP policy.	BMP Policy - Section 2.1
	3. Structure, functions, and procedures of the BMP Committee which is responsible for developing, implementing and maintaining the BMP Plan.	BMP Plan Development and Implementation - Section 2,
	4. Specific management practices and standard operating procedures to achieve the above objectives, including, but not limited to, the following:	Discharge Management – Section 4.1, Operating Practices for Regulated Discharges – Section 7
	i. modification of equipment, facilities, technology,, processes, and procedures,	
	ii. reformulation or redesign of products,	
	iii. substitution of materials, and	
	iv. improvement in management, inventory control, materials handling or general operational phases of the facility.	
	5. Risk identification and assessment.	Facility Security and Vessel Support – Section 3
	6. Reporting of BMP incidents. The written reports must include a description of the circumstances leading to the incident, corrective actions taken and recommended changes to operating and maintenance practices and procedures to prevent recurrence.	Equipment Failure and Repair – Section 10, Documentation and Recordkeeping – Section 11, Training – Section 12
	7. Materials compatibility.	Discharge Management – Section 4.1
	8. Good housekeeping.	Housekeeping -Section 8
	9. Preventative maintenance.	Maintenance - Section 9
	10. Inspections and records.	Documentation – Sections 4.6 and 11.3
	11. Security.	Discharge Management - Section 4.3
	12. Employee training.	Training - Section 12

**Best Management Plan – Permit by Reference Table**

<b>Permit Cite</b>	<b>Permit Special Conditions: Best Management Practices Plan Requirements</b>	<b>Plan Section</b>
IV.B.5. Page 58-59	b. Include the following provisions concerning BMP Plan review: 1. Annual review by exploratory facility engineering staff and the exploratory facility manager.	BMP Plan Modification & Annual Review – Section 14
	2. Annual review and endorsement by the permittee's BMP Committee.	
	3. Include a statement that the above annual reviews have been completed and that the BMP Plan fulfills the requirements set forth in this permit. The statement shall be certified by the dated signatures of each BMP Committee member as certification of the annual reviews.	BMP Plan Certification Statement- Section 2.3
	4. The permittee must submit a copy of the annual certification statement to the Director with the December DMR.	
	c. Establish specific best management practices to meet the objectives identified above, addressing each component or system capable of generating or causing a release of significant amounts of pollutants, and identifying specific preventative or remedial measures to be implemented.	Equipment Failure and Repair – Section 10
	d. Establish specific best management practices or other measures which ensure that the following specific requirements are met: 1. Ensure proper management of solid and hazardous waste in accordance with the regulations promulgated under the Resource Conservation and Recovery Act (RCRA). Management practices required under RCRA regulations shall be referenced in the BMP Plan.	Discharge Management – Section 4.1,  Operating Practices – Section 7.2,  Referenced Documents – Section 13
	2. Reflect requirements for oil spill response plans under 30 CFR Part 254 and 33 CFR Part 154 and may incorporate any part of such plans into the BMP Plan by reference.	
	3. Reflect requirements for storm water control under Section 402(p) of the Act and the regulations at 40 CFR 122.26 and 122.44, and otherwise eliminate to the extent practicable, contamination of storm water runoff.	

**Best Management Plan – Permit by Reference Table**

<b>Permit Cite</b>	<b>Permit Special Conditions: Best Management Practices Plan Requirements</b>	<b>Plan Section</b>
IV.B.5.d. Page 59	4. Reflect requirements for air emissions under applicable state and federal air quality regulations and permits.	Referenced Documents - Section 13
	5. Identify chemical additive inventory procedures (i.e., implementation procedures, calculation methods, record-keeping and reporting procedures) to ensure compliance with the Section II.A.12. of this general permit.	Drilling Fluids Plan (DFP) and Appendix D
	6. Select and implement cooling water intake structure design and construction technologies or operational measures for minimizing impingement mortality and entrainment of fish and shellfish.	Preventive Maintenance – Section 9
	7. Ensure that intake/exchange activities minimize the risk of introducing non-indigenous/invasive species to the Chukchi Sea.	Operating Practices – Section 7.1
IV.B.5 Page 59-60	e. Include the following specific BMPs:  1. Ensure that solid, sludges, or other pollutants removed in the course of treatment or control of water and wastewaters are disposed of in a manner such as to prevent any pollutant from such materials from entering navigable waters.	Discharge Management – Section 4
	2. Separate used motor oil from deck drainage collection systems.	<b>Not Applicable</b>
	3. Minimize wastewater treatment system upsets by the controlled usage of deck drainage washdown detergents and of ice prevention materials to ensure worker safety on decks and work areas.	Deck Drainage – Section 7.2
	4. Reduce oil spillage and oil leaks from pump bearings and seals through the use of good prevention techniques such as drip pans and other handling and collection methods.	Preventive Maintenance– Section 9

**Best Management Plan – Permit by Reference Table**

<b>Permit Cite</b>	<b>Permit Special Conditions: Best Management Practices Plan Requirements</b>	<b>Best Management Plan Section</b>
	5. If oil is used as a spotting fluid, careful attention to the operation of the drilling fluid system could result in the segregation from the main drilling fluid system of the spotting fluid and contaminated drilling fluid. Once segregated, the contaminated drilling fluid can be disposed of in an environmentally acceptable manner.	<b>Not Applicable</b>
	6. When possible, substitute standard drill pipe threading compound (pipe dope) with “toxic metals free” pipe dope.	Preventive Maintenance - Section 9
IV.B.5.e. Page 60-61	7. Careful application of standard drill pipe dope to minimize contamination of receiving water and drilling fluids.	Drilling Fluids Plan
	8. Substitute diesel oil with less toxic mineral oil or synthetic based material in drilling fluid applications.	
	9. When possible, substitute standard drilling fluid additives with less toxic additives.	
	10. Careful handling of drilling fluid materials and treatment chemicals to prevent spills.	Housekeeping Practices - Section 8.2
	11. Use of local containment devices such as liners, dikes and drip pans where chemicals are being unpackaged and where wastes are being stored and transferred.	Housekeeping Practices – Section 8.3
	12. Install treatment devices for deck drainage to reduce or remove pollutants in the discharges (e.g., oil/water separators, sediment tanks/basins, or detention ponds).	Deck Drainage -Section 7.2
	13. Maintain proper cathodic protection to prevent the corrosion of the ship’s hull.	Cathodic Protection – Section 9.8

**Best Management Plan – Permit by Reference Table**

<b>Permit Cite</b>	<b>Permit Special Conditions: Best Management Practices Plan Requirements</b>	<b>Best Management Plan Section</b>
IV.B.6. Page 60	The permittee shall maintain a copy of the BMP Plan at the exploratory facility.	BMP Plan Development and Implementation -Section 2
IV. B.7.	The permittee shall amend the BMP Plan whenever there is a change in the exploratory facility or in the operation of the exploratory facility that materially increases the generation of pollutants or their release or potential release to the receiving waters. The permittee must also amend the BMP Plan, as appropriate, when facility operations covered by the BMP Plan change. Any such changes to the BMP Plan must be consistent with the objectives and specific requirements listed above. Any changes to the BMP Plan must be reported to the Director in writing.	BMP Plan Modification and Annual Review -Section 14
IV.B.8. Page 61	All changes in the BMP Plan must be reviewed by the exploratory facility engineering staff, exploratory facility manager and the BMP Committee. The amended BMP Plan must include a certified statement that the above reviews have been completed and that the BMP Plan fulfills the requirements set forth in this general permit. The certified statement must include the dated signatures of each BMP Committee member as certification of the reviews of the amended BMP Plan. All changes in the BMP Plan must be reported to the Director in writing with the annual certification required under Paragraph B.5.b. above. The permittee must submit a copy of the certified statement and a report of all changes in the BMP Plan to the Director and DEC with the December DMR.	BMP Plan Development and Implementation –Section 2

## 1. Shell Exploration Program

This section identifies Shell Gulf of Mexico, Inc. (Shell) as the operator for the Chukchi Sea Exploration Program and as holding the Notice of Intent for Authorization to Discharge under the National Pollutant Discharge Elimination System (NPDES) for Oil and Gas Exploration Facilities on the Outer Continental Shelf in the Chukchi Sea, Alaska, General Permit (GP) AKG-28-8100.

### 1.1 Sub-Contracts

Shell has contracted with Transocean Offshore Deepwater Drilling, (Transocean) is the owner of the drill platform, MODU (Mobile Offshore Drilling Unit) Polar Pioneer (*Polar Pioneer*), for all operations of the vessel during transit and while Chukchi Sea exploration activities are being conducted. Transocean has specific corporate policies in place that provide for training manuals and programs related to safety & environmental risk assessments and compliance tracking systems as it applicable to all oil and gas exploration operations. Diagrams related to operations and maintenance of all discharges are attached and can be found in Appendix B.

Facility location, permittee name, and facility (rig) owner are listed in Table 1-1 below:

**Table 1-1      Operating Company**

<b>Facility Location</b>	Burger Prospect of the Chukchi Sea. Well locations per lease block are specified in Table 1-2.
<b>NPDES General Permit Number</b>	NPDES GP (AKG-28-8100) effective November 28, 2012.
<b>NPDES Permittee</b>	Shell Gulf of Mexico, Inc. (Shell)
<b>Facility (Rig) Owner</b>	Transocean Offshore Deepwater Drilling (Transocean)
<b>Facility Name</b>	MODU <i>Polar Pioneer</i>

### 1.2 Exploration Wells Location

Shell currently plans to drill six exploratory wells in the Burger Prospect of the Chukchi Sea. The prospect location is depicted in Figure 1-1 and specific well locations are identified in Table 1-2.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 1 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>

## 2. BMP Plan Development and Implementation

Development and implementation of the Best Management Practices (BMP) Plan was based on requirements as described in 40 Code of Federal Regulation (CFR) 435 (Addendum B to Appendix 7 to Subpart A), guidance provided in the United States Environmental Protection Agency's (EPA) "Guidance Manual for Developing Best Management Practices (BMP)" (EPA 833-B-93-004), and a review of the facility operations.

This facility has implemented a BMP system in conjunction with the required monitoring of all effluent discharges under the NPDES GP. The monitoring program is described in Section 4, Discharge Management; Section 6, Fluids Management; and Section 7, Operating Practices for Regulated Discharges. Practices and management to ensure compliance with other Federal requirements, such as: solid and hazardous waste regulations promulgated under the Resource Conservation and Recovery Act, oil spill response regulations found under 30 CFR Part 254 and 33 CFR Part 154, air quality emissions in accordance with state and federal air quality regulations, and storm water control under Section 402(p) of the Clean Water Act and the regulations of 40 CFR 122.26 and 122.44 are incorporated by reference if applicable (See Reference Documents, Section 13).

### 2.1 Implementation

Implementation of the BMP will be introduced to each employee during the training as described in Section 12. The BMP policy statement will be posted in key rig locations. Blank NPDES Daily Activities Report forms are found in Appendix A. Vessel diagrams are found in Appendix B.

The Quality Assurance Project Plan (QAPP) is available for review as a separate plan.

The standard operating procedures (SOPs), permit(s) to work (PTWs), and local work instruction(s) (LWIs) for the *Polar Pioneer*, applicable to this BMP plan, are incorporated into this plan by reference and are listed in Appendix C.

Safety Data Sheets, formerly known as Material Safety Data Sheets (MSDS) for chemicals in use aboard the *Polar Pioneer* are available online, with a back-up copy available from the Safety Training Supervisor. Chemicals onboard are managed as stated in the LWI found in Appendix D.

### 2.2 General Reporting

General inspection reports/records must be completed and kept as part of this BMP Plan during drilling operations; a copy is maintained on the rig. In addition, the following records will be completed if equipment operation occurs and maintained as part of the BMP on the rig and submitted at the end of the season to Shell.

- NPDES Daily Activities Report – for monitoring and visible observations (foam, floating solids, and sheen), flow rates, and samples taken.

Shell and Transocean will have full time Health, Safety and Environmental (HSE) staff on board during the operational periods. Blank NPDES Daily Activities Report forms to be used on the *Polar Pioneer* can be found in Appendix A.

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 5 of 50
<b>CAUTION: All hardcopies of "Controlling Document" are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 2.3 Policy Statement

BMPs have been developed and implemented on the drillship *Polar Pioneer* to control and minimize waste generated and discharged during drilling exploration activities offshore of the OCS in Alaska. These practices are part of the pollution prevention program on the *Polar Pioneer* resulting in the following: (1) savings in materials, pollution control, and potential liability costs; (2) enhanced work environment safety; and (3) increased efficiencies.

This BMP Plan, written to address NPDES GP requirements, will be improved upon continuously with the goal of always controlling generated waste and reducing liquid and solid discharges. This BMP Plan includes guidelines for good housekeeping, equipment maintenance and operation, cleanup of spills and leaks, inspections, recordkeeping and training.

## 2.4 BMP Plan Committee

The BMP Committee is responsible for the development, implementation, and continued review and modification of this BMP Plan. The BMP Committee is comprised of:

- Shell Wells Superintendent (*Polar Pioneer*) – Eric Whatley
- Shell Engineering Team Lead– Jason Smith
- Shell Environmental Manager – Lucy Jean
- Transocean Rig Superintendent – Samuel Beverland

The BMP Committee has delegated the actual work of preparing the BMP Plan and overseeing its implementation to contractor support staff. The BMP Committee members listed above have direct responsibility or relevant knowledge to this BMP Plan. In addition to the committee members above, the owner operating company, Transocean, has reviewed the BMP Plan and is contractually committed to comply with the applicable regulatory requirements.

## 2.5 BMP Certification Statement

The annual review of this BMP Plan and audit of the *Polar Pioneer* has been completed by Shell and, as applicable, any other individuals responsible for the development and implementation of the BMP Plan. This BMP Plan fulfills the requirements for BMP Plans set forth by 40 CFR 435, NPDES GP, and the guidelines set forth within EPA's Guidance Manual for Developing Best Management Practices (BMP) written in October 1993. Upon signature by the following responsible individuals, this BMP will be considered complete and in effect.

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 6 of 50
CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.	

**Table 2-1      BMP Committee Signatures**

<b>Name</b>	<b>Title</b>	<b>Signature</b>	<b>Date</b>
Eric Whatley	Shell Wells Superintendent		
Jason Smith	Shell Engineering Team Lead		
Lucy Jean	Shell Environmental Manager		
Samuel Beverland	Transocean Rig Superintendent		

The Shell Wells Superintendent, Engineering Team Lead, and Environmental Manager are primarily responsible for knowing the content of this BMP. BMP Plan modifications and annual review requirements are detailed in Section 14 of this plan.

### 3. Facility Security and Vessel Support

Shell and Transocean have existing security plans in place that restrict access to the *Polar Pioneer* and employees with access to the ship are provided training on these security measures. Aboard the vessel, management of security is handled by Transocean. Transocean also has detailed confidential security plans in place per the requirements set forth under the applicable regulations of Maritime Security (MARSEC) and International Ship and Port Security (ISPS).

#### 3.1 Facility Description

The *Polar Pioneer* is a mobile, floating offshore oil and gas drill platform designed for operations in harsh conditions such as the Arctic Ocean and North Sea. The *Polar Pioneer* is a floating semi-submersible drill platform with an 8-point anchored mooring system and is also equipped with four dynamic positioning thrusters. The hull has been reinforced for ice resistance. The *Polar Pioneer* has all necessary drilling equipment and ancillary facilities to drill, evaluate and abandon exploration wells in the Chukchi Sea of Alaska. The key components specific to compliance with the NPDES GP for the *Polar Pioneer* include but are not limited to:

- vessel capacity for approximately 114 people,
- mud handling system and solids control equipment,
- potable water system,
- non-contact equipment cooling supplied by general seawater service line (GSSL),
- system isolation by lock out/ tag out (LO/TO) procedures,
- deck drainage processor,
- oil/water separator (OWS), and
- marine sanitation device (MSD) with reverse osmosis (RO) system.

Diagrams for the *Polar Pioneer* are contained in Appendix B.

#### 3.2 Planned Vessel Support

During exploration drilling operations, the *Polar Pioneer* will be attended by support vessels that will be used for ice management, anchor handling/ice management, oil spill response (OSR), refueling, resupply, waste removal, discharge monitoring and servicing of the drilling operations.

## 4. Discharge Management

This section and Section 7 describe the discharges for which Shell has requested authorization from EPA; including the discharge limits for each effluent stream, how effluents will be monitored, and what actions will be required if permit limits are exceeded. Chukchi Sea discharge monitoring must follow the procedures specified in the NPDES GP. For specific explanation of the requirements of the NPDES GP, please refer to NPDES AKG-28-8100. For specifics on testing and sampling procedures, please refer to the QAPP.

### 4.1 Effluent Disposal

For the purpose of this document, an effluent is a discharged wastestream, or water, that is regulated. The volume and concentration of discharge varies over time to some extent depending on the activities at the facilities. Concentrations of effluent parameters are reported electronically each month on the Discharge Monitoring Report (net DMR) and submitted to EPA.

Specific drilling fluid formulations, equipment, processes, material compatibility, chemical products, and processes have been examined to minimize estimated volume and toxicity for each discharge. Transocean has procedures that address handling of solids, sludges, or other wastes generated from facility operation or treatment systems. These procedures are written to prevent any pollutant from such materials to be spilled or have an uncontrolled release.

Aboard the *Polar Pioneer*, the discharge caisson (shunt line) is a consolidated discharge point. Drilling fluids and cuttings are collected aboard the vessel to a point on the main deck near the mud room. A 15-inch outer diameter (OD) pipe exits the bottom of the deck underneath the main hull and is routed to the Port second support leg. The shunt line is welded to the Port #2 Column from top to bottom and extends approximately 20 feet below the surface of the water when the vessel is at normal operating draft. Since the shunt remains open to the sea at all times, the shunt line is constantly filled with sea water to mean sea level. This shunt is not equipped with a “float” valve; it is open to the sea so the waste streams are continually discharged below sea level.

The *Polar Pioneer* utilizes an open-loop saltwater supply piping design that provides continuous saltwater flow throughout the rig for all onboard requirements except the fire control water. This General Seawater Service Line (GSSL) provides continuous flow for the Low Temperature Fresh Water Loop to cool the machinery systems. It is also a back-up system that provides direct cooling to the entire rig in the event of a catastrophic failure of the Low Temperature Fresh Water Loop. The advantage to the GSSL design in providing inherent system redundancy is due to the multiple (four) suction pumps that feed the system.

Pumps are operated on a pressure demand basis in that pump utilization is based on system demand requirements with individual pumps operating in unison and/or independently based on overall demand requirements. The four pumps are located in the stern section of each pontoon with header pipes connected to the central loop. There are two additional branches to the GSSL; one branch is used to fill the mud pits with seawater if needed and also wash cuttings down the cuttings shoot or auger; the other branch of the GSSL is a supply line used for the mud and the rig brake heat exchangers. The rig brake has a primary fresh water cooling loop that flows through two saltwater heat exchangers that are supplied

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 11 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

from the GSSL. These two lines discharge through the secondary mud shunt located on the P2 column after they are sampled. Sampling ports have been installed on two separate branches prior to co-mingling with the mud and cuttings.

In addition, a single discharge / return line is located on the Starboard #4 Column and serves as the primary discharge for the GSSL. The secondary discharge for the GSSL is a return line located on the Port #2 Column. Lastly, with multiple and redundant pumps connected to the GSSL, the ability to conduct required maintenance while the system is operating on any of the pumps without impacting the operation of the rig can be successfully accomplished due to the inherent redundancy of multiple pumps feeding the continuous loop. The system is designed to operate on minimal numbers of pumps but if system demand increases, additional pumps are automatically brought on line to meet the additional demand requirements.

## 4.2 Discharges Covered by BMP Plan

During the operating season, Shell plans to drill in waters of greater than 40 meters. A vessel anchored or in dynamic positioning over a lease block is considered a point source and is regulated by EPA under the NPDES GP and also 40 CFR Part 435. The following lists the types of discharges the *Polar Pioneer* has requested authorization for under the NPDES GP for Oil and Gas facilities on the OCS in the Chukchi Sea:

<u>Discharge Number</u>	<u>Discharge Description</u>
001	Drilling Fluids and Drill Cuttings
002	Deck Drainage
003	Sanitary Wastes
004	Domestic Wastes
005	Desalination Unit Wastes
006	Blowout Preventer Fluid
007	Boiler Blowdown
008	Fire Control Test Water
009	Non-contact Cooling Water
010	Uncontaminated Ballast Water
011	Bilge Water
012	Excess Cement Slurry
013	Muds, Cuttings, Cement at Seafloor

During Shell's exploration operations in the Chukchi Sea, only water-based drilling fluid will be used and discharged from the *Polar Pioneer*.

<b>AKG-28-8100 – <i>Polar Pioneer</i> January 2015</b>	Page 12 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

In accordance with the Shell Burger Prospect Drilling Fluids Plan, no mineral oil pills will be used during the exploration drilling program.

#### **4.3 Discharge Security**

Procedures and measures have been instituted to address the potential for an accidental discharge to the Chukchi Sea. General protocols to prevent the accidental discharge of non-permitted material include, but are not limited to; trained personnel, suitable chemical/hazardous materials storage areas and containers, sump alarms, door sills, high level alarms, placards to promote awareness of permit requirements, operating treatment systems, system isolation (lockout /tag Out), and identification tags located on valves that could lead to potential discharges to the Chukchi Sea. Placards are posted on the facility identifying NPDES GP points. LWIs will be in effect for any discharge valves. An LWI is established and followed by all staff involved with any discharge being conducted. A NPDES Compliance Specialist will be onboard to verify GP conditions and requirements are met.

For specific guidance and understanding of sampling requirements, refer to the specific requirements set forth in the QAPP, LWIs and SOPs.

#### **4.4 Discharge Volumes by Method, Equipment and Location**

Authorized discharges occur from a limited number of discharge points located on the vessel. The volumetric amount of these waste discharges will either be read from independent digital flowmeters or estimated by calculation. To more precisely measure and monitor individual discharges, flow meters and temperature indicators have been installed at several locations. Discharge volumes not metered will be estimates, based on calculations. Domestic waste volume will be calculated based on the number of persons/individuals on-board (POB) the vessel while in operation.

The discharge type, discharge equipment, volume method and location on the vessel are presented in Table 4-1. The monitoring schedule and applicable discharge limits are provided in the QAPP tables for all authorized discharges.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 13 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

**Table 4-1 Discharges by Type, Equipment, Method and Location**

Discharge	Type of Discharge	Discharge Equipment	Volume Method	Location
001	Drilling Fluids and Drill Cuttings	Shunt Line	<b>Estimate:</b> ONE-TRAX software (M-I SWACO proprietary) operational data input and Pit Volume Totalizer	Port #2 Column
002	Deck Drainage	Direct / OWS	<b>Estimate:</b> Total square meter area multiplied by actual daily precipitation per event	Direct
003	Sanitary Waste	MSD	<b>Meter</b>	Port #1 Column
004	Domestic Waste	Direct	<b>Estimate:</b> 75 gallons / POB / day	Port #1 Column
005	Desalinization Water	Evaporator Units	<b>Meters</b>	GSSL
006	Blowout Preventer Fluid	BOP	<b>Estimate:</b> Manufacture Certificate, test fluid volume	Deck or surface water test
007	Boiler Blowdown	Boiler	<b>Estimate:</b> Manufacture Certificate, test fluid volume	Direct at Port and Starboard #4 Column
008	Fire Control System Test Water	Overboard Deck Drain	<b>Estimate:</b> Flow rate multiplied by duration	Overboard
009	Non-contact Cooling Water	General Service Supply Line	<b>Meter</b>	Starboard #4 Column
010	Uncontaminated Ballast Water	Ballast Tanks	<b>Estimate:</b> Ballast Control Officer's Daily Report	Port and Starboard Pontoons
011	Bilge Water	OWS	<b>Meter</b>	Overboard
012	Excess Cement Slurry	Cement Unit	<b>Estimate:</b> Tank capacity volume	Overboard

#### 4.5 Discharge Monitoring Reports

Inspections of discharge sources include visible observations (foam, floating solids, and sheen), measurements, and sample collection and testing during operations. The information contained in the netDMR and written correspondence will routinely be submitted to Shell. At the completion of monthly data compilation, the following information will be submitted to EPA, per the reporting stipulations of the GP:

- required sampling results and
- data from samples collected more frequently than required by the GP.

Facility personnel will follow standardized monitoring and sampling procedures related to each discharge and Compliance Specialists will be on-site to verify compliance to the provisions of the NPDES GP.

#### **4.6 Discharge Reporting and Notifications**

The NPDES GP requires that traceable records of routine and non-routine discharges be maintained. Shell's operator reporting system will track and maintain on-site documentation for authorized discharges. The forms are utilized to maintain a daily or weekly record of key discharges to assess compliance of drilling waste management during exploration activities. (Blank NPDES Daily Activities Report forms are provided in Appendix A.)

Shell is responsible for all compliance reporting to regulatory agencies. Monitoring results will be summarized and submitted monthly by the 20th day of the following month. Annual sampling results will be reported on the January DMR of the following year. All records of monitoring information shall be retained by the permittee at least 5 years from the date of the sample, measurement, report, or application.

Noncompliance or change in discharge toxicity, as detailed in Section 11.3, will be reported to the EPA by telephone within 24 hours from the time of occurrence or as per permit requirements. This includes any unanticipated bypass or upset that exceeds discharge limitations in the permit or any violation of maximum daily discharge limitations for any of the pollutants requiring 24-hour reporting as listed in Part 1 of the GP.

If any of the discharge limits are exceeded or if other suspected BMP Plan non-compliance or modification occurs, the Shell Compliance Duty Officer (907-830-7435) must be called immediately.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 15 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 5. Drilling Mud and Solids Control Operation

Drilling fluids, otherwise known as “drilling mud” or “mud”, consist of a base fluid along with various mud products that are used to control wellbore pressure, lubricate drill-string, remove cuttings, suspend solids, reduce fluid loss to formation and maintain formation integrity. Drilling fluid, returned to surface from the wellbore, is separated from the formation cuttings at the shale shaker, limiting the amount of drilling fluid discharged with the cuttings. New drilling fluid and/or the base fluid is continually added to the surface system to maintain sufficient volume and reduce low gravity solids percentage during drilling operations.

The solids control equipment (SCE) is used to maintain drilling fluid properties at required parameters. LGS, or Low Gravity Solids, comprised mostly of drill cuttings, are kept at a minimum in the active drilling fluid system with the SCE. Solids removal efficiency depends on the processing equipment and formation characteristics.

Mud pits are used to store and recondition drilling fluid (mud). This BMP covers active mud pits, reserve mud pits, the piping associated with drilling fluid transfer, and mixing apparatus. The active mud system feeds mud directly to the wellbore. Reserve mud pits are used to store whole mud and specialized pills needed throughout the well.

These cleaning methods shall include, but are not limited to, the following general procedures:

- confined space entry permit, if entering a pit, and
- approved cleaner, if needed and tracking the concentrations and volumes of cleaners used.

BMPs for proper control and safe operational uses of the drilling fluid and the SCE involve securing valves and preventing unplanned discharges (see Section 9). All pits and flow lines are marked or identified and all discharge (dump) valves are identified and have redundant containment. Noble’s written procedures for all drilling mud and solids control equipment are incorporated by reference into this BMP and provided in Section 13.0, Referenced Documents.

### 5.1 Solids Control Equipment and Operation

As drilling fluids return from the wellbore, the fluids pass through a series of equipment that removes the solids so the fluid can be reused. The primary solids removal equipment is the shale shakers which provide an initial separation of drilling muds from drill cuttings. From the shakers, the drilling fluid is sent to the sand traps which are a series of three pits that allows solids to settle out. If the overall LGS percent starts to rise, the desilter/mud cleaner and centrifuges can be used for additional processing. This equipment is intended to remove solids from the mud that has passed through the shale shakers.

Low efficiency SCE results in high accumulated solids in the drilling fluid. If the solids cannot be removed by the SCE, the solids content and rheological properties of the drilling fluid must be controlled by adding fresh drilling fluid, base fluid and/or products to the mud system. In other words, SCE which operates with high efficiency can reduce the drilling fluid volume required to drill a given well, thereby minimizing the waste generated.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 16 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

The operation of the SCE should be consistent with the manufacturer's design criteria or recommendations. Equipment design and operation will depend on drilling fluid characteristics, mainly type, flow, density, and rheological properties.

Policies and procedures are referenced in Section 13, Referenced Documents.

## **5.2 Mud Pit System**

The operation of the drilling mud system should be consistent with the manufacturer's design criteria or recommendations. Equipment design and operation will depend on drilling fluid characteristics, mainly type, flow, density, and rheological properties. Recognizing that each drilling operation is unique, the drilling mud system should be designed and operated, to the extent practical, consistent with API RP 13C.

Agitators in mud pits help added mud products added to go into solution and to suspend solids. Without any agitation, excessive drill solids can accumulate in dead spaces of a mud pit. Mud pits also use gun lines to which circulate mud within the pit to help agitate fluid in corners and mix added mud products. Solids are typically drilled cuttings but may also include added materials such as barite, bentonite and calcium carbonate. At the completion of the well, mud pits are emptied and cleaned.

## **5.3 Active and Reserve Pits**

The mud pits are used to condition and store drilling fluids and condition drilling fluid (mud). The active mud system feeds mud directly to the well bore through the drill string when circulating conventionally. The "active" mud pit system contains four pits in a rectangular room directly adjacent to the mix/sack/pump room. Reserve mud pits refer to pits that are not part of the active system. These pits can be used to store whole mud for fluid additions to the active system, as well as for storing excess and different fluids.

There are two "active" drilling fluid pits located on the Machinery Deck and hold approximately 42,000 gallons of drilling fluid. In addition, four reserve pits, with a total storage capacity of approximately 60,000 gallons are also available. The reserve pits are located adjacent to the active pits. In addition, two storage mud tanks (P-12 and P-13) containing a total of approximately 121,000 gallons are fully enclosed and located in the lower hull (pontoon). Two storage tanks (S-13 and S-17) located below in the pontoons may be used for the storage of additional brine of approximately 230,000 gallons. Lastly, one slop tank (P-17) has storage capacity of approximately 74,000 gallons and three non-potable freshwater storage tanks (P-6, P-7 and S-6) of approximately 515,000 gallons are located in the lower hull (pontoon). A listing of all storage tanks and tank capacities can be found in Appendix C.

All Mud pits and Storage Tanks are fully enclosed and have no exposure to the outside environment. All pits are considered confined space entry and are subject to applicable health and safety requirements. All testing of drilling fluids will be performed in the Mud Lab. Each pit has a sample point that will facilitate the collection of samples for required tests on the drilling fluid. The tests will be performed at a sink that will aid in the cleaning of the equipment after the tests are completed. Agitators are routinely used in mud pits to help keep solids in suspension. Each of the pits in the active and reserve systems has agitation to limit the buildup of solids.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 17 of 50
<b>CAUTION: All hardcopies of "Controlling Document" are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## **5.4 Shale Shakers and Sand Trap**

The shale shakers, located on the main deck, are utilized to remove the cuttings from the drilling mud returned from the well. The shale shaker design, together with the screen characteristics and the shale shaker deck angle, controls the size of the cuttings separation and the length of time that the drilling mud and cuttings spend on the screen. Screen characteristics affecting the efficiency of cuttings separation include mesh size, conductance, number of layers, type of construction and non-blanked area.

The goal of the shale shakers is to achieve high LGS removal efficiency, which results in solids as dry as possible (when discharged) and an optimum cut point. The screens on the shakers will be sized to handle the expected process rates for the drilling operation and maintain the required quality of the drilling mud.

The operation of the shale shakers must be balanced between the amount of low gravity solids (LGS) in the drilling fluid and the amount of drilling fluid retained on the discharged cuttings. A balance must be struck between the dryness of the cuttings (how much fluid is removed) and the carryover of fine solids in the mud, which degrades its quality and causes operational issues with the fluid.

Mud, returned by the flow line and processed through the shale shaker equipment, is then routed to the sand traps. The sand traps, which are located in a row parallel to and at the same elevation as the main pits (and upon which sit the shakers and various other SCE), have no agitation or jetting capability. The sand traps overflow into adjacent pits, routed by connecting troughs, returning into the active system or processed through additional mud cleaning equipment.

## **5.5 Degasser and Discharge Pits**

After the drilling fluids passes over the shale shakers and flows into the sand traps, the returning fluids can be processed through the degasser before fluid is sent back into the active system.

The degasser is used if gas from the wellbore is introduced into the mud system causing the weight of the drilling fluid to decrease. Fluid processed through the degasser will be returned back to the active pits.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 18 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>

<b>AKG-28-8100 – <i>Polar Pioneer</i></b> <b>January 2015</b>	Page 19 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 6. Fluids Management

Maintenance and operational requirements are covered by manufacturer's manuals. The BMP plan addresses industry standard practices for active mud pits, reserve mud pits, the piping associated with drilling fluid transfer, blending apparatus, and solids control equipment. Proper pit maintenance and cleaning methods will minimize the potential for the build-up of mud solids and unnecessary discharge of drilling fluids. Proper fluid management minimizes the amount of muds adhering to drilled cuttings before discharge overboard, removes drill cuttings from the muds to prevent incorporation into the mud, and maximizes the recovery of drilling fluid for reuse. This will also minimize the potential for buildup of drill cuttings (including accumulated solids) in the active mud system.

Prior to adding mud to any pit, it is standard practice to ensure that pits are clean and no fluid remains in the pit. Before fluid is added into any pit, all valves which would allow fluid to be discharged directly overboard will be securely closed. These valves will be labelled and tagged to reduce the potential of a non-permitted discharge. These valves will not be opened unless the Compliance Specialist is notified and all required samples and testing have been performed.

### 6.1 Pit Cleanout

At the end-of-well or if the drilling fluid being used must be swapped, the pits must be cleaned. This task will only be completed after approved by the Compliance Specialist and the Drilling Foreman. Once pits are emptied, water can be used to rinse pits for additional cleaning. Water used to rinse one pit will then be transferred to other pits which will reduce to over waste discharged. A hose can also be used to help clean the sides and remove build up.

BMPs for mud pits focus on securing valves, proper operation and preventing unplanned discharges as part of general good housekeeping (see Section 8). Pits and lines are marked and the discharge (dump) valves will have placards and/or color-coded schemes. Written procedures for mud pits that are incorporated by reference into this BMP are provided in Section 13.0, Referenced Documents. General housekeeping practices for mud pits are listed in Table 6-1.

**Table 6-1 Housekeeping Practices for Mud Pits**

BMPs for Housekeeping of Mud Pits	
<b>Surface Pits</b>	
	<ul style="list-style-type: none"><li>• A pressured water line will be used for general cleaning on and about the pit area, including the shaker and shaker screens.</li><li>• Absorbent pads or mats will be installed at entry/egress points of the mud pit area to prevent the tracking of residues to other areas of the rig.</li></ul>
<b>Subsurface Pits or Tanks</b>	
	<ul style="list-style-type: none"><li>• Written procedures will be followed for transferring and measuring volumes and agitating with internal gun lines.</li><li>• Cleanout procedures will require special entry permits and will be reviewed by permit(s) to work (PTW) for the cleanout.</li></ul>

The rig is equipped with a series of interactive control and monitoring systems which continually update the volume of drilling fluid in each of the pits and storage tanks. Overflow and overfill level indicators are included in the active monitoring system. In addition, the active monitoring systems are also capable of metering all incoming make-up material in case there is a loss of drilling fluid due to formation issues. Lastly, the drilling fluids active monitoring systems are capable of monitoring the volume of cement that is introduced to the wellbore during cementing operations. Sensor data is displayed in following areas:

- the Rig Floor (Driller’s console monitor),
- the Mud Lab,
- the Derrick Man’s office,
- the Drilling Foreman’s Office,
- the Assistant Rig Manager’s Office.

## 6.2 Pit Maintenance and Operation

Equipment BMPs for mud pits focus on operation and equipment. The purpose of focusing on the operation and equipment for the mud pits is to conduct safe and effective drilling operations and to implement controls to prevent leaks and spills. Equipment maintenance and operating procedures incorporated by reference in this BMP are listed in Section 13, Referenced Documents. General maintenance and operation of mud pits are listed in Table 6-2.

**Table 6-2 Maintenance and Operation of Mud Pits**

BMPs for Maintenance and Operation of Mud Pits
<p><b>General</b></p> <ul style="list-style-type: none"> <li>• Secure discharge (dump) valves on all surface mud pits and water lines to the mud pit area during mud operations.</li> </ul> <p><b>Operation</b></p> <ul style="list-style-type: none"> <li>• Run agitators continuously when mud is in the pit.</li> <li>• Inspect agitators to verify proper working order.</li> </ul> <p><b>Clean-Out Pits</b></p> <ul style="list-style-type: none"> <li>• Pump out muds for disposal after consulting with the Compliance Specialist who will ensure proper testing and record keeping. Flush with water. Follow valve-securing procedures before entering mud pit and complete final clean out of pits.</li> <li>• Following the opening of the discharge (dump) valves, inspect and reseal according to proper procedures, with particular attention to potential leaking of the valve to volumes upon first refilling the pit.</li> <li>• Evaluate solids buildup from pit cleanout to pit cleanout:</li> </ul> <p><b>Good Housekeeping</b></p> <ul style="list-style-type: none"> <li>• For surface pits, use adsorbent mats at entry/egress points of the mud pit area to prevent the tracking of mud residues to other areas of the rig.</li> <li>• Follow written procedures for transferring, measuring volumes, and agitation. Cleanout procedures will be reviewed and PTW performed for cleanout.</li> </ul>

### 6.3 Mud Pit System Inspections

The visual inspection of the mud pit system is the responsibility of the Derrick man or designee. The Derrick man or designee are required to maintain proper fluid levels in the mud pit system during all times drilling operations are on-going. In addition, the Derrick man or designee is required to conduct periodic inspections of the drilling fluid levels and the overall conditions of the mud pit area. Any problems requiring attention are to be noted on the Derrick man's Daily Report which is submitted at the end of each shift. Operation, maintenance, and repair regarding the mud pit system are to be included in the overall mud pit system inspection records. The Derrick man or designee is responsible to verify that equipment inspections, preventative maintenance and general housekeeping of the mud pit area is conducted and compiled in a timely fashion. In addition, the Mud Engineer maintains separate documentation and records (Daily Mud Report) specific to drilling fluid requirements throughout the drilling operations. Record keeping responsibilities will be in accordance with the substantive requirements set forth in the NPDES GP. Applicable records will be maintained on the rig and following the drilling season, will be on file with Shell.

### 6.4 Solids Control Equipment Management Practices

This section addresses BMPs to minimize the amount of WBM adhering to drill cuttings before discharge overboard, to remove drill cuttings from the WBM to prevent incorporation into the mud and to maximize the recovery of drilling fluid for reuse. It also describes BMPs to minimize the potential for buildup of drill cuttings (including accumulated solids) in the active mud system. Cleanup and other good housekeeping procedures incorporated by reference in this BMP Plan are listed in Section 13, Referenced Documents. General SCE housekeeping practices are listed in Table 6-3.

**Table 6-3 BMPs for the SCE**

BMPs for SCE
<ul style="list-style-type: none"> <li>• Keep work areas clean, neat, and accessible.</li> <li>• Store materials properly.</li> <li>• Be sure all transfer lines are clearly marked.</li> <li>• Conduct preventative maintenance on equipment, including major process units and their connections, pumps, and valves as outlined by the manufacturer.</li> <li>• Operate shakers properly to prevent mud overflow.</li> <li>• Keep floors clean and free of clutter and tripping hazards.</li> <li>• Keep sinks and work surfaces clean and neat.</li> <li>• Keep stairways clean, accessible, and free of tripping hazards.</li> <li>• Keep hoses clean and neatly /safely stored.</li> <li>• Have sufficient cleanup equipment and materials readily available.</li> <li>• Cleanup leaks and spills promptly.</li> <li>• After transferring bulk material from solids control pits, remove residual mud with vacuum or discharge according to the NPDES GP.</li> <li>• Conduct visual inspections to verify correct practices and detect problems, if any, weekly when in use.</li> </ul>

#### 6.4.1 Shale Shakers

The shale shaker design, together with the screen characteristics, controls the efficiency of the cuttings separation and the length of time that the drilling mud and cuttings spend on the screen. Screen characteristics affecting the efficiency of cuttings separation include mesh size, conductance, number of layers, type of construction, non-blanked area, and deck angle.

Table 6-4 below lists general guidance for these parameters. Policies and procedures referenced in this BMP Plan are listed in Section 13, Referenced Documents.

**Table 6-4 BMP for Shaker Operation**

BMPs for Shaker Operation	
<ul style="list-style-type: none"> <li>• Screen tension should be maintained at the optimum torque for that shaker. Tension should be checked after 30 minutes of operation following installing new screens and daily thereafter.</li> <li>• The screen deck angle should be maintained to manufacturer's recommendations during normal operation.</li> <li>• Leave at least one butterfly valve (furthest from the flow line entry point) in the fully open position, and restrict valves to the other shakers as required to distribute flow evenly.</li> <li>• Optimize screen coverage on the lower deck by maintaining a relatively small stream of fluid discharging with wet cuttings from the second screen onto the lower drying screen.</li> <li>• During routine operations, returns from the hole will go over the shakers.</li> <li>• Physically inspect the shaker area to monitor the operation of the shakers, inspecting screens for holes and tears and washing off screens of any caked or dried mud/solids.</li> <li>• Visually monitor shaker area and adjust pumps to accommodate shaker conditions.</li> <li>• When in use, inspect weekly and record to verify correct practices.</li> </ul>	

Table 6.5 below lists general maintenance activities for shakers.

**Table 6-5 BMP for Shaker Maintenance**

BMPs for Shaker Maintenance	
<ul style="list-style-type: none"> <li>• Maintain motors as per contractor's preventative maintenance instructions (PMI) [see Section 13, Referenced Documents].</li> <li>• Replace worn or damaged components as needed, including decking rubbers, decking strips, tension rails, springs, and screens (check for wear, tears, or abrasion).</li> </ul>	

Inspections of shale shaker equipment will be recorded routinely.

#### 6.4.2 Fines Removal Equipment

Fines removal equipment is necessary on the rig to remove drilled solids that are smaller than 70 microns. The desander / mud cleaner contains cones designed to remove fines greater than 70 microns, and the desilter / mud cleaner is designed with cones to remove fines 30 microns and greater. Fluid properties and suspended solids properties (mainly size and weight) determine which equipment is used to remove the fines. The centrifuge on the *Polar Pioneer* used for fines removal will remove particles down to 5 microns. Varying the bowl speed varies the gravitational force applied to the fluid with this equipment. Inspection of centrifuges and other fines removal equipment will occur routinely when equipment is in use.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>		Page 23 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>		

## **6.5 SCE Inspections**

Inspection of the SCE is the responsibility of the Derrick man and will be routinely conducted when SCE equipment is operated. BMP hard copy forms are filed in the corresponding tab of the NPDES WBM Environmental Records Binder. The Derrick man is responsible for ensuring work place inspection and equipment maintenance are completed and records are maintained, although certain tasks may be delegated to qualified individuals.

Execution of these responsibilities will also follow existing Transocean operating procedures and policies. Any additional record keeping responsibilities will be in accordance with M-I SWACO operating procedures and policies and will be in compliance with the substantive requirements set forth in the NPDES GP.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 24 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 7. Operating Practices for Regulated Discharges

All discharges will be monitored with observation/tests and analytical results recorded to demonstrate compliance with the NPDES GP. For specific information, refer to the QAPP, SOPs, LWI, and PTWs listed in Appendix C and see Referenced Documents, Section 13 for practices incorporated by reference. Inspection observations will be recorded on the NPDES Daily Activities Report. Completed NPDES Daily Activities Reports will be forwarded to Shell. A reference diagram depicting all discharge locations can be found in Appendix B – Diagrams.

### 7.1 Water-based Drilling Fluids and Drill Cuttings (Discharge 001)

All drilling fluids go through a chemical review process before being listed in the Drilling Fluids Plan. Only drilling fluid additives to pass the suspended phase particulate (SPP) toxicity test (list included in Drilling Fluids Plan) will be used in drilling the well.

After the well cellar is established, the riser is installed on the rig which allows water based muds and cuttings to return to surface for processing and re-use. All muds and cuttings are discharged below the sea surface (See Discharge Points Figure in Appendix B). All drilling fluids and cuttings pass through a shunt line that is attached to the Port #2 Column and discharge approximately 35 feet below water surface adjacent to the Port Pontoon. The shunt line also receives non-contact cooling water that allows for more efficient flow of the effluent to the discharge caisson.

WBM and cuttings can be directly discharged off the vessel to the Chukchi Sea below the water surface only when specific valves are aligned and opened in the sequence. Emergency Diverter controls are housed in the drill shack on the drill floor and are only used under catastrophic events. In order to open or activate the diverter, two switches must be activated simultaneously, after unlocking the panel door. The Driller is the custodian and operator of all well control equipment and has the authority to close well control equipment or divert straight overboard in a well control emergency situation.

On-site monitoring of drilling operations will be recorded routinely when in operation into the driller's log. All laboratory and monitoring data will be submitted to Shell. On-site monitoring includes housekeeping measures which confirm that:

- Chemicals will be stored in closed containers and the drill floor kept clean and organized.
- Inspections will be performed while operating to identify potential spills and leaks and to verify chemical inventory. Inspection observations will be recorded on the NPDES Daily Activities Reports; blank forms can found in Appendix A. Completed NPDES Daily Activities Reports will be forwarded to Shell.
- Holding pits and tanks will be cleaned as needed; systems will be flushed as needed; and piping and joints will be repaired / replaced as needed.
- The Mud Engineer is responsible for tracking the rate chemicals are added so as not to exceed SPP toxicity testing listed in the Drilling Fluid Plan.

<p>AKG-28-8100 – <i>Polar Pioneer</i> January 2015</p>	<p>Page 25 of 50</p>
<p><b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b></p>	

## **7.2 Deck Drainage (Discharge 002)**

The deck containment system is designed to capture spills, leaks, cleaning water, wash water, rain water and snow melt. Interior decks in high-risk areas employ measures for spill containment. The external deck system includes a vacuum system with some effluent piped to a receiving tank and then processed as necessary prior to being discharged into receiving waters. Internal deck drains are piped to receiving tanks with the effluent then being directed to the bilges and finally processed through the OWS prior to discharge to the receiving waters. Any free-oil remaining in the water is piped to the hazardous bilge tank for holding and then processed through the bilge separator (OWS) located in the Starboard #4 Column beneath the Machinery Deck. The remaining water fraction is co-mingled with the GSSL and discharged to the receiving waters adjacent to the Starboard #4 Column

The remaining water fraction will be discharged in accordance with the requirements of the D-002 waste criteria. Once processed in the OWS and prior to release overboard via the GSSL discharge located adjacent to the Starboard #4 Column, a sample of the effluent will be collected for TAH and TAqH analysis.

The heliport deck does have containment as required by regulations. The drains from the 0-1 Deck, which contain the heli-fuel tanks and pump unit, are routed to the deck drain collection system. Heliport and exterior decks will be inspected routinely to verify that no contaminants are present for run-off.

Housekeeping measures include:

- all drains will be mapped out and visually inspected routinely by the Compliance Specialist. Special attention will be given to direct overboard drains;
- drains may contain a removable plug; that at times will be used to control a spill to a confined area in the event of a release to the deck;
- drains will be visually inspected as needed to verify plugs are in place;
- only environmentally sensitive detergents and deicing compounds will be sparingly used to clean or de-ice decks;
- the decks and floors will be kept clean of debris to prevent plugging of the drains;
- containers with closing lids will be used to minimize/prevent accidental spills on to decks;
- spills will be contained and cleaned up immediately to prevent contamination of drainage; and
- the oil/water separator will periodically be cleaned to maintain effectiveness as needed.

Prior to drilling, the Compliance Specialist will perform a pre-operational inspection and routine inspections during drilling. Visual inspections of deck drainage areas are to verify proper operation and to document any signs of pipe leaks or spills. Deck drainage discharge is recorded per discharge. Inspection observations will be recorded on the NPDES Daily Activities Report. Compliance inspections will be in accordance to the published SOPs. Applicable SOPs can be found in Appendix C. Completed NPDES Daily Activities Reports will be forwarded to Shell.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 26 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

### 7.3 Sanitary Wastewater (Discharge 003)

Sanitary waste (black water) consists of human waste from toilets and urinals. The volume of this waste varies with occupancy and treatment systems. The Type II MSD is a biological aerobic (bacteria and air) sewage treatment system installed and located in the Port #1 Column beneath the Machinery Deck. This Piranha Model MSD meets the International Maritime Organization's MEPC 115(51) Guidelines and US Coast Guard certification; it is also equipped with a Reverse Osmosis unit.

The MSD consists of three treatment stages; aeration, clarification, and disinfection. All sewage water passes through a wastewater grinder before passing into the aeration chamber (stage 1), the bacteria grow and multiply using the sewage as their food supply. This action reduces the quantity and size of the solid matter. In the clarification chamber (stage 2), the bacterial flocculent is separated from the treated solid matter. The treated water is clear and free from solids; however, the liquid must be disinfected prior to discharge overboard to kill any disease-causing bacteria. Disinfection is accomplished in the clarification chamber (stage 3).

Flow through these three stages is caused by direct displacement. When new sewage flows into the aeration chamber, an equal volume flows through the clarification chamber. This volume, in turn, displaces an equal volume from the clarification chamber into the disinfection chamber, and overboard. No internal sewage pumps are necessary.

Liquids will be monitored by a flow meter and sampled using a port located near the flow meter and upstream of the discharge point. Discharge of the MSD to receiving waters occurs beneath the Port #1 Column under the Port Pontoon. In addition, the effluent from the MSD can also be routed for holding onboard the *Polar Pioneer* in an existing drill water tank located in the Port Pontoon. Discharge from this tank can be either offloaded for onshore processing or be routed overboard. The MSD is to be inspected annually by a third party competent person with a valid certificate of inspection available upon request.

Housekeeping measures include:

- using only cleaners that are compatible with the treatment system,
- keeping the treatment system free of debris,
- periodically inspecting and/or changing membranes where applicable,
- using only marine biodegradable toilet paper, and
- will be inspected and the flow rate observed, as directed by manufacturer or annually.

Visual inspections of piping and joints will be performed to confirm placards are placed where needed and to verify that valves and tagging exist to prevent spills and leaks. Monitoring data will be recorded. Inspection observations will be recorded on the NPDES Daily Activities Report. Completed NPDES Daily Activities Reports will be forwarded to Shell.

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 27 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

#### **7.4 Domestic Wastewater (Discharge 004)**

Domestic wastewater (gray water) is defined as materials discharged from showers, sinks, safety showers, eye-wash stations, hand-wash stations, galleys, and laundries. It is also generated in food preparation areas. The volume of these wastes varies widely with time and the assigned ship's occupancy. While operating under the requirements of the NPDES GP, all domestic wastewater will be discharged overboard adjacent to the Port Pontoon, without any co-mingling with any other effluent source. Samples will be taken routinely during all drilling operations to ensure that D-004 effluent meets limitation standards.

Housekeeping measures include:

- solid food will be prevented from being washed down the sinks,
- sinks with grease traps in place,
- grease traps will be cleaned routinely or as needed, and
- only compatible cleaners will be used.

Visual inspections of piping and joints will be performed to verify foam or floating solids are not present and will inspect piping and joints to identify the potential for spills and leaks. Placards will be placed at kitchen sinks identifying prohibited products and discharge guidelines. All on-site monitoring will be recorded routinely. Inspection observations will be recorded on the NPDES Daily Activities Report. Completed NPDES Daily Activities Reports will be forwarded to Shell.

Items accumulated for disposal from the execution of the above housekeeping activities will be stored in appropriate disposal containers as provided in Shell's (Waste Management Plan) WMP and Transocean's WMP. Transfer and ultimate disposal of any item noted above will comply with Shell Operations Plan S0011 – Marine Transportation Operations and Shell Operations Plan S0055 - Lifting and Hoisting Plan.

#### **7.5 Desalinization Unit Wastes (Discharge 005)**

Desalinization unit waste consists of residual high-concentration brine, similar to seawater in chemical composition and is discharged through disposal caisson. Three freshwater evaporators are located in the Starboard #1 Column beneath the Machinery Deck and are used to produce approximately 20,000 gallons per day potable water. No biocides will be added to this system. Effluents from the units are discharged to the GSSL for discharge to the receiving waters adjacent to the Starboard #4 Column.

#### **7.6 Blowout Preventer (Discharge 006)**

The blowout preventer (BOP) is an emergency hydraulic system that releases a lubricating discharge to actuate the well head control safety hydraulic equipment. This small amount of effluent will either be captured on rig or surface-water sampled during testing. When testing prior to deploying the BOP subsea, the fluid is captured in a contained space or area. Once the BOP is deployed, all releases will occur below surface water during function tests.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 28 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

### 7.7 Boiler Blowdown (Discharge 007)

Conducting boiler blowdown is required for ensuring proper maintenance of the boiler. Boiler blowdown consists of water and minerals drained from boilers discharged. One boiler is located in the top of the upper section of the Port #4 Column and another is located at the Starboard #4 Column. Discharge of the boiler blowdown occurs as a high pressure, high temperature steam. Boiler blowdown vents are located approximately 80 feet above the sea surface. Boiler blowdown effluent will be sampled and tested prior to discharge.

### 7.8 Fire Control System Test Water (Discharge 008)

The fire control system consists of untreated seawater released during the training of personnel in fire protection and the testing and maintenance of fire protection equipment. Effluent will either go directly overboard or will be collected on the decks and be piped to the deck drainage system for discharge. No biocides or other chemicals are added to the system. U.S. Coast Guard requires this system to be tested once per month; the vessel may conduct tests by sections or more frequently than required.

### 7.9 Non-contact Cooling Water (Discharge 009)

The General Seawater Service Line (GSSL) is non-contact cooling water used to cool freshwater cooling loops installed machinery located at various places on the *Polar Pioneer*. No biocides or chemicals will be added to this system. All primary non-contact cooling water originates from two Sea Chests located on the inboard sides of the Port and Starboard Pontoons located in the stern. Seawater is drawn from these two Sea Chests and then is routed through the GSSL via four suction pumps and is contained. All secondary loops used for cooling water consist of fresh water and pass through heat exchanger units. No intermixing of fresh and salt water occurs between the primary and secondary loops.

In addition, independent digital flow meters have been installed on primary and secondary discharge lines to monitor flow and temperature (see Table 4-1). The majority of Non-contact Cooling water is discharged through the GSSL discharge line located adjacent to the Starboard #4 Column; however a portion of Non-contact Cooling water is discharged to the Shunt line located adjacent to the Port #2 Column.

### 7.10 Uncontaminated Ballast (Discharge 010)

Ballast water consists of seawater added or removed to maintain the proper float, level, and ship draft. This water is authorized for discharge, and is intended to be discharged regularly. Ballast water is discharged below sea level adjacent to the Pontoon's. No biocides or chemicals will be added to this system.

Water intake/exchange activity in the ballast tanks of the *Polar Pioneer* will be performed in transit to Alaska to prevent entrapment and introduction of any invasive species into the Chukchi Sea.

### 7.11 Bilge (Discharge 011)

Excess bilge water is discharged from three ports located on each of the inboard side of both pontoons. Two bilge pumps are provided in each pump room. Ballast pumps can be used as emergency bilge pumps for discharging water from the pump rooms. The bilge pumps transfer bilge from the pontoons, braces,

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 29 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

voids, double bottoms, columns, trunks, etc. to the bilge water tank. Bilge collected from the Main hull safety zones rea is collected in tanks by gravity. Deck drainage processors are provided to separate mud from the bilge. The bilge is pumped from the holding tank to deck drainage processor by pollution pump. Separated mud is dumped into the cutting holding pit.

Bilge collected in bilge tank is transferred to the bilge OWS by pump (located in aft starboard column) and the separated oil is transferred to waste oil tank. Effluent water with oil content lower than 15 PPM is pumped overboard through a three way valve which can return non-compliant water to the bilge tank or to discharge to the GSSL located adjacent to the Starboard #4 Column.

An International standard connection is provided on the starboard side of Main Deck for transfer of bilge and used oil from the vessel for shore based disposal. Oil from the bilge separator is transferred to the waste oil tank and from waste oil tank to the transport tank for offloading.

### **7.12 Excess Cement Slurry (Discharge 012)**

Excess cement slurry is the rinsate coming off equipment during wash-down and after a cementing operation. Sample will be obtained and tested prior to discharge. Effluent discharge is to the Shunt line located adjacent to the Port #2 Column.

### **7.13 Muds, Cuttings, and Cement at Seafloor (Discharge 013)**

These materials are discharged at the ocean floor in early phases of drilling operations, before the riser is deployed and during well abandonment and plugging.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 30 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## **8. Housekeeping Practices**

### **8.1 Waste Minimization Practices (WMP)**

Waste minimization utilizes source reduction, recycling, and reuse to reduce the potential for pollution prior to its generation. Source reduction includes, but is not limited to, process modification, raw material substitution, and energy conservation which lead to a reduction in the amount and/or toxicity of a process residual. Source reduction can be achieved by using chemicals effectively and by operating and maintaining treatment systems according to equipment manuals. Recycle and reuse involves the reclamation or reuse of process residuals for beneficial purposes. Useful constituents of a residual, such as hydrocarbons, may be reclaimed for reuse. For specific guidance and understanding of waste minimization requirements, refer to requirements set forth in Shell's WMP and Transocean's WMP.

### **8.2 Work Areas**

Good housekeeping means maintaining clean and orderly work areas. With good housekeeping, it is easy to move around work areas, materials and equipment are easy to locate and operate the potential for spills and leaks are reduced, operational conditions prevent impacts to marine life, and work areas are safer for workers.

Good housekeeping practices include:

- orderly storage of chemicals and other materials,
- designated areas for materials and activities,
- proper labeling of areas, equipment, and materials,
- prompt cleanup of spills and leaks,
- drip pans and
- routine inspections to verify that practices are being implemented and to detect any problems needing attention.

Segregation of domestic solid waste and hazardous waste will follow the waste management procedures in Shell's WMP and Transocean's WMP. No overboard discharge of solid waste will take place except for permitted discharges during the Alaska exploration project. Domestic solid waste will be transferred to service vessels and disposed of in approved permitted solid waste units onshore. Recyclable hazardous materials, such as absorbent pads, batteries, fluorescent lamps, and used oil will be segregated and shipped to approved onshore facilities.

Shell's current WMP lists recycling options to be utilized whenever possible for OCS operations. The list of recyclable material includes the following:

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 31 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

- lubricating oil and filters,
- spent organic solvents and miscellaneous chemicals, re-used on a case-by-case basis,
- drilling fluid additives and
- scrap metal and drums.

Good housekeeping practices for mud pits and the solids control system were described in earlier chapters of this BMP Plan. For specific guidance and understanding of waste minimization requirements, refer to requirements set forth in Shell's WMP and Transocean's WMP.

### 8.3 Vessel Housekeeping

The Transocean's Health & Safety Policies and Requirements contain standards for vessel housekeeping operations. The following housekeeping SOPs for chemical and waste handling procedures will be utilized for other areas of the vessel not previously described:

- housekeeping
- hazardous materials handling ,
- containment of hydrocarbons and chemicals,
- drainage and discharge,
- spills,
- emissions,
- recycling and waste reduction (HSE assessments and audits) and
- operation control & safe systems of work –Isolations.

### 8.4 Loading Stations

Loading/unloading lines for diesel, mud, brine, oily water (slops), cement, barite, and bentonite have two valves as a barrier. There is also a padlock on every main valve on the loading and unloading lines, and the key for opening these valves are in the control room and require a work permit approval. All hoses are frequently changed out due to be on the safe side of wear and tear. Fuel hoses have a weak-link breakaway couplings, safety breakaway, Dry Disconnect Couplings (quick release) and extra floatation (protection).

### 8.5 Material Compatibility and Storage

Proper storage and handling of laboratory and industrial chemicals will reduce the potential for personnel and environmental accidents. A chemical inventory will be kept on board that details each chemical product, unit amount, and location by locker unit. Six basic principles will be followed for chemical use on the *Polar Pioneer*:

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 32 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

- only necessary amounts of chemicals for safe operation will be stored,
- chemicals will be transferred from bulk containers to smaller containers for controlled use,
- all containers will be inspected for required labeling,
- incompatible chemicals will be segregated,
- personal protective equipment (PPE) will be used when identified on the SDS and
- adequate spill response/clean-up materials will be accessible.

Shell policy requires a Permit to Work (PTW) when planning on a task that is outside of routine duties. This PTW system will be used by personnel when handling and segregating chemicals for storage, transferring into containers, and labeling.

Storage requirements for chemicals aboard the *Polar Pioneer* include:

- flammable liquids will be stored in metal cabinets away from heat or ignition sources and provided with proper ventilation,
- bases and acids will be stored separately,
- oxidizers will be separated from organic compounds,
- special precautions will be taken for peroxides, peroxide forming compounds, and especially organic peroxides,
- chemicals reactive with water or air (such as sodium or phosphorus) will have special handling and storage according to labeling and the SDS and
- gas cylinders will be properly labeled and double fastened to the wall or cabinet that has been bolted to the floor. When not in use, cylinders will be capped to protect the stem.

## 8.6 Chemical Product Handling

Chemical products are limited onboard and do require special handling and storage. The personnel handling chemicals aboard the *Polar Pioneer* will have the training, knowledge, and appropriate PPE for safe use and handling. For storage purposes, often a secondary container can provide the protective barrier between incompatible chemicals. The SDS provides guidance for storage and handling as well as spill clean-up procedures.

Shell, Transocean, and M-I SWACO provide training manuals and information for their respective employees' use and ensure compliance. Storage of hazardous materials will be in compliance with Shell's Standard Operations Plan S0011 Rev 2 – Marine Transportation Operations and Transocean Drilling Waste Management Manual.

<p><b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b></p>	

## 9. Preventive Maintenance and Operation

Preventive maintenance and proper operation of equipment can reduce the potential for impacts to the environment and marine life, prevent minor losses of materials from leaks and spills, and minimize waste streams from treatment systems. Equipment that is maintained and operated properly is cleaner and less prone to leaking, spilling, and generating waste. Some preventive maintenance practices would also be considered good housekeeping practices (keeping valves and fittings from leaking, for example); however, this BMP Plan does not make a strict distinction between the two. A description of preventive maintenance and the operations of some equipment are provided below.

### 9.1 Cooling Water Intake Structure

The *Polar Pioneer* was built in 1986, so the velocity requirement for cooling water intake is not applicable. On this drilling vessel, seawater flows past screened openings located on the inboard sides of each pontoon and fills the Sea Chests. The Sea Chests acts as a storage reservoir for the seawater prior to being suctioned into the GSSL for distribution and use. Seawater then is circulated around the vessel through the GSSL and this water passes through various heat exchangers that are connected to secondary loops that then cool the specific piece of equipment. It would be unlikely for any marine life to be entrapped in the tank. Water intake/exchange activity will be performed while the vessel is in transit to Alaska.

### 9.2 Deck Drainage Processor

There is a deck drainage processor on the vessel for separating small amounts of wastewater and mud spills from the deck. After collection, the water would be separated by gravity. Being stationary, static oil will separate from the water and float to the top of the system. This will allow the oil to be skimmed off and sent to the oil collection tank.

### 9.3 Oil/Water Separator

All liquids that drain to the bilge will be processed through one oil/water separator located on the deck of the vessel. The oil collection tank is located directly below the separator. Spills from the tanks, shakers, and pump room all drain into the separator. Other sumps on the rig that could possibly contain oil/water waste also feed into the separator. The oil/water separator is United States Coast Guard approved.

### 9.4 Lubricating Oil Purification Units

Lubricating oil purification units will be used to reduce the number of engine oil changes and oil filter replacement, reducing the volume of used oil generated.

AKG-28-8100 – <i>Polar Pioneer</i> January 2015	Page 35 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## **9.5 Chemical Storage Areas**

Additives and chemicals will be properly stored and protected to minimize uncontrolled releases or potential weather impact. Particular attention will be given to loading and unloading dry or wet chemicals during operation. Standard procedure for chemical transfer includes securing the area and maintaining spill response equipment on hand during the operation. SDS will be readily available to confirm proper storage of all hazardous materials and will be located online as well as in hardcopy in areas where chemicals are stored / used. All chemicals onboard are managed as stated in the local work instruction, a copy can be found in Appendix D.

Chemical storage areas and hazardous materials will be segregated to prevent incompatible materials from being stored together. For specific guidance and understanding of proper storage of hazardous materials, refer to the product Safety Data Sheets, Transocean's Safety Policies and Requirements Manual and Transocean's Environmental Policies and Requirements Manual. For waste minimization requirements, refer to requirements described in Shell's WMP, Transocean's WMP, and Transocean's Safety Health and Safety Policies and Requirements.

## **9.6 Equipment Spillage and Leak Prevention**

Combustion engine, pump bearings, seals, and hydraulic equipment are fitted with drip pans and containment devices. Examples include drip pans beneath lubricating oil systems on engines and containment vessels or dikes under fuel and chemical storage areas. Regularly scheduled preventive maintenance on equipment, pumps, piping systems, hoses, and valves will reduce the potential for leaks or releases of chemicals to containment systems or to the environment. Routine inspection will verify proper equipment operation and implementation of corrective action if required.

## **9.7 Pipe Dope**

Only lead-free pipe dope will be used for drill pipe connections. A stringent control program has been established to confirm proper application, container handling, and final disposal of excess dope material.

## **9.8 Loss of Drilling Mud**

Drill pipe trips in and out of the hole can contribute to excess mud waste on the rig floor. The outer surface diameter of the pipe will be wiped clean, as necessary, under safe conditions while pulling out the pipe, reducing the spilled mud and the need for rig wash.

## **9.9 Cathodic Protection**

Transocean will maintain proper cathodic protection to prevent the corrosion of the vessel hull. Sacrificial anodes were installed on the underwater portions of the hull during the 2014 shipyard period.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 36 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 10. Equipment Failure & Repair

### 10.1 Equipment Failure or Discharge Limit Exceeded

All discharges are managed in accordance with the requirements of the NPDES GP.

During regular drilling operations, WBM, cement washdown water, cement mix water and cooling water from the cement unit, and drilling fluids are discharged from the shale shakers, cement unit overboard line, the mud cleaner unit, and the fines removal unit (High Speed Centrifuge) will be discharged. Other discharges from the vessel will originate from deck drainage, MSD, oil/water separators, desalination units, BOP, boilers, fire control test water system non-contact cooling water system, and ballast tanks.

Shell and the Shell Drilling Engineer will be notified IMMEDIATELY when:

- excess WBM and fluid volumes are over the established hourly limits,
- any one piece of equipment breaks down multiple times during drilling, or
- other circumstance to result in significant amount of a pollutant reaching surface water.

An engineering review and analysis of the problem may be warranted.

If any of the discharge limits are exceeded or if other suspected BMP Plan non-compliance or modification occurs, Shell must be called immediately. Such notice includes:

- any non-compliance that endangers health or environment,
- any unanticipated bypass or upset that exceeds any effluent limitation in the NPDES GP (see Section V.F, “Bypass of Treatment Facilities” in NPDES GP),
- any activity that causes an upset that exceeds any effluent limitation in the NPDES GP (see Section V.G, “Upset Conditions”);
- any violation of a maximum daily discharge limitation for any of the pollutants in Section II of the NPDES GP requiring 24-hour reporting or
- any activity that would result in a discharge, on a routine or frequent basis, of any toxic pollutant that is not allowed in the NPDES GP, but exceeds the highest of the notification levels found in Section III.H.1. and 2. of the NPDES GP.

In addition, if a circumstance results in significant amount of a pollutant reaching the surface, the Compliance Specialist will record the direction, rate of flow and total quantity of the pollutant estimated to be discharged from the vessel as a result of the condition or circumstance.

Depending upon the circumstances, the BMP Plan may require modification within 14 days in accordance with the NPDES GP requirements. For detailed information on the NPDES GP Discharge Limitations and Prohibitions, see Section III, Drilling and Workover Operations of the Alaska OCS Environmental Compliance Manual (ECM); and this BMP Plan Section 4, Discharge Management.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 37 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## **10.2 Equipment Repair / Servicing (Preventative Maintenance)**

All discharge equipment downtime will be reported on the appropriate BMP form for the specific piece of equipment.

If MSD unit fails or sample results return out of compliance, the black water holding tank can hold up to 20 days of raw black water to allow system repair or batch discharge to a support vessel.

The solids control equipment manages solids and minimize retention of fluids on the cuttings. If this equipment is in need of servicing, the following discharge options are listed below:

- continue to operate only if within discharge limitations as stated under the BMP Plan through the end of the entire interval drilled with drilling fluids and,
- monitor drilling fluids from the point of SCE breakdown through the end of the entire interval drilled with drilling fluids or,
- discontinue discharge of any specific waste stream if that waste stream is not within discharge limitations with discharge to continue after repair and/or servicing of equipment.

All WBM, cutting discharges, and equipment downtime will be reported on the appropriate BMP form for the specific piece of equipment.

### **10.2.1 Shale Shaker**

In case of failure or servicing of a shale shaker, the unit will be taken off-line and flow will be diverted to the remaining shale shakers in operation. Discharge from the shaker will resume after it has been repaired/serviced.

### **10.2.2 High-Speed Centrifuge**

In case of failure or servicing of the high-speed centrifuge, this unit will be taken off-line and any direct discharge from this unit will cease. For optimum solids control, it may be necessary to route the effluent of the centrifuge to the mud cleaner for processing with concomitant discharge of the fines. Discharge from the high-speed centrifuge will resume after it has been repaired/serviced.

## **10.3 Detailed Contingency and Muds and Cuttings Containment Plan**

Preventative maintenance of all SCE must be performed in accordance with manufacturer's specifications as demonstrated by the preventative maintenance records of Transocean; who is responsible for operating, maintaining, and repairing the SCE.

This requirement and those specified in Section 6, must be verified prior to discharging drilling fluids and cuttings over shakers when equipment is being routinely maintained or repaired.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 38 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

#### **10.4 Materials Handling and Records/ Equipment Failure/Discharge Records**

Transocean is responsible for record keeping for all equipment failures. Any equipment failures must be documented on the BMP Daily Activities Report and copies submitted to Shell.

All discharge records will document when a no discharge event is observed.

##### **10.4.1 Contingency Plan Records**

Transocean is responsible for contingency planning, preventative maintenance and record keeping for all equipment failures. Any equipment failures must be documented on the BMP Daily Activities Report and copies submitted to Shell.

##### **10.4.2 Waste Manifest Records**

Copies of waste manifests are kept on file at Shell.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 39 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

*This page intentionally left blank.*

<b>AKG-28-8100 – <i>Polar Pioneer</i></b> <b>January 2015</b>	Page 40 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 11. Documentation and Recordkeeping

The NPDES GP starts on the date and time when the first anchor is set at the drill site and continues until the last anchor is removed from this location. Inspections of all discharge sources will be conducted at times of occurrence or routinely when not discharging.

A copy of this BMP Plan and its related documentation will be maintained by the facility operator and will be made available to EPA upon request. All NPDES GP required BMP records will be retained by Shell.

### 11.1 Required Reporting

Reporting includes written information contained in the DMR and/or in correspondence. Information that must be reported is listed in the following tables.

**Table 11-1 Reporting Tables**

<b>Records for General Housekeeping</b>
<ul style="list-style-type: none"><li>• Inspection records for general housekeeping.</li><li>• Documentation regarding BMP (re-)evaluation.</li><li>• Feedback records for BMP improvement.</li></ul>

**Table 11-2 Discharge with Cuttings**

<b>BMP Records for Discharges Associated with Cuttings</b>
<ul style="list-style-type: none"><li>• Inspection / equipment maintenance / repair records for mud pits and solid control equipment.</li><li>• Drilling mud / cuttings housekeeping records.</li><li>• Sampling and laboratory testing records.</li><li>• Training records related to BMPs.</li></ul>

In addition to the routine data submitted to Shell for compilation and reporting to EPA, the following sampling data will be reported to Shell each month:

- required monthly sampling results,
- data from samples collected more frequently than required by the GP and
- in-house data that complies with EPA analytical method requirements.

Documentation and records related to general issues, the mud pits, and the solids control system are listed in the tables below, in corresponding sections of the BMP Plan.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 41 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

**Table 11-3 Discharge without Cuttings**

Records for Discharges Not Associated with Cuttings	
<ul style="list-style-type: none"> <li>• Inspection / equipment maintenance / repair records for rig / drill floor.</li> <li>• Inspection / equipment maintenance / repair records for pumps &amp; mixing areas.</li> <li>• Inspection / equipment maintenance / repair records for mud pits.</li> <li>• Inspection / equipment maintenance / repair records for fluid transfers. <ul style="list-style-type: none"> <li>○ Mud Discharges.</li> <li>○ The NPDES Record Form and laboratory testing records covering: <ul style="list-style-type: none"> <li>○ deck drainage discharge,</li> <li>○ sanitary and domestic waste,</li> <li>○ desalination unit waste,</li> <li>○ blowout preventer fluid,</li> <li>○ non-contact cooling water,</li> <li>○ uncontaminated ballast water,</li> <li>○ boiler blowdown,</li> <li>○ fire control test water,</li> <li>○ bilge water discharge,</li> <li>○ excess cement slurry discharge.</li> </ul> </li> </ul> </li> </ul>	
	<ul style="list-style-type: none"> <li>• Training records related to BMPs.</li> </ul>

## 11.2 Housekeeping Reporting

Housekeeping inspection of work areas and equipment must be completed routinely during operations, maintenance, and repair. Facility personnel will follow standardized monitoring, sampling and record keeping procedures related to each discharge.

General housekeeping, rig floor and mixing area activities will be noted and recorded on the NPDES Daily Activities Report, will be kept as part of this BMP, will be kept on file at Shell and on the rig. The housekeeping monitoring results will be reported on the NPDES Daily Activities Report.

The Offshore Installation Manager will be responsible for inspections and maintaining the inspection and preventative maintenance records, although they may delegate certain tasks to qualified individuals. Delegations of these responsibilities can be found in existing Transocean operating procedures and policies.

All records regarding the drilling fluid equipment will be completed and collected from Transocean by the Compliance Specialist. Transocean is responsible for all operations, maintenance and repairs to all the drilling fluid equipment installed on the vessel. These records are required by both the NPDES GP and this BMP Plan. Copies will be maintained on the rig by the Compliance Specialist and transferred to Shell.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>		Page 42 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Liveline®.</b>		

Inspections of all discharge sources will be monitored at times while on-site in accordance with the provisions of the NPDES GP. Each of the discharges observation/tests and analytical results will be recorded to verify compliance of the NPDES GP.

### **11.3 Non-Compliance or Change in Discharge Toxicity Notifications**

If any of the discharge limits are exceeded or if other suspected BMP Plan non-compliance or modification occurs, Shell must be called immediately at (907) 830-7435. If NPDES GP non-compliance occurs, Shell will complete and file the necessary reports with EPA in accordance with permit requirements.

### **11.4 Associated Documentation and Manuals**

Other documents or manuals that contain related pollution prevention measures include:

- Shell - Exploration Plan,
- Shell - Oil Spill Response Plan, and
- Shell and Transocean - Waste Management Manuals.

In addition, relevant Shell, M-I SWACO, and Transocean procedures, documents, policies, LWIs and manuals applicable to the requirements of the NPDES GP, are incorporated by reference in this BMP and are maintained at the facility and for Shell documents, at Shell.

### **11.5 Records Retention**

Pursuant to permit regulations, records will be retained by Shell for a period of at least five years from the date of the sample, measurement, report, or application, whichever is longer. Records are maintained electronically and/or in hardcopy. Record retention includes:

- copies of all reports required by the permit (DMRs, etc.),
- a copy of the NPDES GP,
- records of all data used to complete the application for this permit,
- original monitoring data, including operator routine duties, operator log books, electronic data capture, or other documents in which monitoring data such as sheen test results are first noted,
- monthly facility flow tables,
- all analytical data packages,
- chain-of-custody forms,
- logs or other documents used to originally record flow meter readings,
- calibration and maintenance records of equipment as they relate to measurement of volume or monitoring quality, and
- NPDES-related training records.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 43 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Liveline®.</b>	

The NPDES GP requires that traceable records of routine and non-routine discharges be maintained. Shell is responsible for all compliance reporting. Monitoring results will be summarized on the DMR form, EPA No. 3320-1 or equivalent, on a monthly basis, and postmarked by the 20th day of the following month. Annual sampling results will be reported on the January DMR of the following year. All records of monitoring information shall be retained by the permittee at least 5 years from the date of the sample, measurement, report, or application.

All noncompliance of the NPDES GP, as detailed in Section 10.3, will be reported to EPA by telephone within 24 hours from the time of occurrence. This includes any unanticipated bypass or upset that exceeds discharge limitations in the permit or any violation of maximum daily discharge limitations for any of the pollutants requiring 24-hour reporting as listed in Part 1 of the GP.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 44 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## 12. Training

Field personnel will be made aware of the NPDES GP related activities with the goal of pollution prevention and waste minimization. Having personnel that have participated in training activities will verify the efficient and effective operation of treatment systems and will ultimately minimize the risk of pollutants discharged to the Chukchi Sea. In accordance with EPA Guidance Manual for Developing BMP Plan, the focus of the BMP Plan training will be to confirm an understanding of the BMP Plan, including the reasons for developing the BMP Plan, sampling requirements as detailed in the Quality Assurance Project Plan (QAPP), the positive impacts of the BMP Plan, and employee and managerial responsibilities under the BMP Plan.

### 12.1 Training Programs

An overview of the training programs provided by Shell and Shell's contractors will be given to all individuals participating in the exploration program involving the *Polar Pioneer*.

Note that training involves individuals of all levels of responsibility. Table 12-1 provides an overview of initial training programs developed and executed to date. Training will be established after the BMP is approved and signed by the Shell Senior Drilling Engineer.

The Tier 1 level of training, Environmental Awareness, is a high-level overview of the types of regulatory programs that are applicable to operations, a high-level description of the mitigation measures that are required, and general reporting structure. This series is intended to provide a general familiarity of the programs that employees and contractors must adhere to. For example, remote personnel and department leads would benefit from taking this training.

The Tier 2 level of training, Environmental Leadership, provides a greater level of awareness regarding each permit/authorization/ agreement. This training will provide a working knowledge of the GP, but will not provide an in-depth description of each permit requirement. This training is anticipated to take approximately four hours.

The Tier 3 level of training, specific NPDES instruction is intended for those with specialized duties and for those who need to know the details of particular permits, sampling requirements, reporting requirements, etc.

Refresher training will occur once crews mobilize to the drill rig. This training will be presented at several daily safety meetings to ensure that all personnel are aware of BMP requirements and general discharge restrictions.

Training will include material handling, equipment maintenance and repair, cleanup, inspections, and record keeping. Training programs for BMP management are listed in Table 12-1.

<b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b>	Page 45 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

**Table 12-1 BMP Training Programs**

Training Programs for BMPs			
Program	Administered by	Subjects Covered	Target Audience
BMP Training	Shell, Transocean and M-I SWACO	<ol style="list-style-type: none"> <li>1. Review of NPDES GP</li> <li>2. WBM sampling &amp; monitoring</li> <li>3. BMP policy &amp; implications</li> <li>4. Best practices for all discharge equipment.</li> </ol>	All personnel affected by the BMP
Shell's Alaska Compliance Manual (ACM) Training	Shell, Transocean and M-I SWACO	<ol style="list-style-type: none"> <li>1. Modification to Environmental Compliance Manual (ECM)</li> <li>2. QAPP sampling &amp; testing</li> <li>3. WBM monitoring &amp; reporting</li> <li>4. BMP development &amp; application</li> </ol>	Drilling managers, superintendents, engineers, foremen, HSE technicians, mud & compliance specialists
Compliance Training & Certification	Shell, Transocean and M-I SWACO	BMP documentation & reporting WBM and all regulated discharges	Compliance Specialist

## 12.2 Training Records

Training records for Shell employees are retained at Shell's office in Anchorage. Original and current training records are maintained by Shell and Shell's Contractors. The refresher training records are maintained and held by each specific contractor.

Field Superintendents are responsible for maintaining required training records, although they may delegate certain tasks to qualified individuals (e.g., HSE technician, compliance engineer). Prior to and during the drilling of each new well, the Field Superintendent will verify that Compliance Specialists affected by this BMP have been trained on the requirements and document the training.

Execution of the BMP training responsibilities will follow existing Transocean operating procedures and policies. Record keeping responsibilities will be conducted in accordance with Transocean operating procedures and policies and will be in compliance with the substantive requirements set forth in the NPDES GP.

## 13. Referenced Documents

### 13.1 Referenced Plans and Documents

All referenced plans and documents may be requested by EPA for review. The following documents in Table 13-1 are incorporated into the BMP Plan by reference:

**Table 13-1 Documents Referenced**

Document Title	Relation to BMP Plan
Shell - Alaska Compliance Manual (ACM)	Segregation of domestic and hazardous waste management procedures. Lists recycling options for lubes & filters, spent organic solvents, drilling additives, and scrap metal and drums.
Shell Contingency Response Waste Management Plan	Addresses the different resources (vessel and other support) for waste management and disposal from spill response.
Shell Alaska Venture Waste Management Plan	Contains policies and procedures for implementing waste management programs.
M-I SWACO Chukchi Drilling Fluid Plan	Contains information on the formulation and maintenance of the drilling fluid.
Transocean's Health & Safety Policies and Requirements Manual	Contains policies and standard operating procedures for housekeeping and chemical handling / storage aboard vessel
Transocean's Environmental Policies and Requirements Manual	Contains handling and storage procedures that are International Convention for the Prevention of Pollution from Ships (MARPOL) V compliant.
Shell - Quality Assurance Project Plan (QAPP)	Defines the quality assurance (QA) and quality control (QC) procedures that will ensure the quality of data obtained from field and laboratory analyses.
Shell – Environmental Monitoring Plan (EMP)	Oceanographic sampling and monitoring plan for collecting baseline data.
Shell, Transocean, and MI-SWACO SOPs, PTWs, and LWIs	Standard Operating Procedures (SOPs), Permit(s) to Work (PTWs), and Local Work Instructions (LWIs) addressing the Chukchi Sea Exploration Program.
Shell –Training Execution Plan	Plan provides structure for the Alaska Venture to deliver required training.
Transocean – <i>Polar Pioneer</i> Waste Management Plan	Specific plan to address waste management onboard the <i>Polar Pioneer</i> .
Transocean - United States Harsh Environment Guidance Document	Controlled document addressing the <i>Polar Pioneer's</i> liquid waste handling.
Transocean Training Matrix	Required training by job title.
Shell Chukchi Sea Oil Spill Response Plan	A regional oil spill response plan for Shell's multi-year Chukchi Sea exploration drilling program
Transocean – Piranha Sewage Treatment Unit	Certificate of Annual Inspection/Service.
Transocean – Waste Management Plan	Reference document of a solid waste management plan

### **13.2 Safety Data Sheets**

Copies of all SDS are held in the Rig Manager's Office. Chemicals onboard are managed by the LWI, a copy can be found in Appendix D. Over all, the Transocean Warehouseman is responsible for the general storing of all hazardous material on each vessel. Specific to the contract firms M-I SWACO and Halliburton, each are responsible for the use of their specific materials and will hold their specific SDS.

<b>AKG-28-8100 – Polar Pioneer January 2015</b>	Page 48 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>	

## **14. BMP Plan Modification & Annual Review**

### **14.1 Certification and Annual Review Requirements**

Certification of the BMP Plan will comply with the substantive requirements set forth by the NPDES GP, Part IV.B.4.b.

The BMP Plan will be reviewed no less than annually by the BMP Committee, and updated as needed. The amended BMP Plan will include a certified statement that the above reviews have been completed and that the BMP Plan fulfills the requirements set forth in this GP. The certified statement includes the dated signatures of each BMP Committee member as certification of the reviews of the amended BMP Plan. All changes in the BMP Plan will be reported to EPA in writing with the annual certification. The permittee must submit a copy of the certified statement and a report of all changes in the BMP Plan to EPA and DEC with the December DMR.

### **14.2 Evaluation and Re-Evaluation**

The BMP reports and records will be routinely reviewed and evaluated to verify that the BMP Plan is effective in achieving the general objective of preventing and minimizing the discharge of wastes to the receiving waters and complies with all other BMP Plan requirements. All changes in the BMP Plan must be reviewed by the exploratory facility engineering staff, exploratory facility manager and the BMP Committee. Timely record reviews performed as part of the monthly DMR process will confirm that mud pits and SCE continue to operate as designed.

This evaluation should be conducted by members of the BMP Committee during “Drill the Well on Paper (DWOP)” exercises and during after action reviews (AAR). These reviews occur in conjunction with equipment vendors and/or industry specialists.

Upon updating, a revised copy is forwarded to the facility and to Shell’s representative who contacts the facility Compliance Specialist to review and discuss the BMP Plan updates. Shell’s representative will visit the facilities no less than once per year and with the Compliance Specialist, and will train the facility personnel on the BMP Plan and associated updates. Representatives from Shell may assist with the training by creating audiovisual presentations.

BMP Committee Members should keep each other informed on the effectiveness of the BMP Plan by regular communication sessions (e.g., on location during regular pre-tour meetings, off location during DWOPs, and in morning meetings as warranted), discussing the benefits generated by executing the BMP Plan (e.g., cost savings generated, reduced waste generator, etc.) and the need for BMP re-evaluation and modification.

### **14.3 Modifying the BMP Plan**

This BMP Plan will be modified whenever there is a change in the facility or in the operation of the facility that significantly increases the generation of wastes or their uncontrolled release or potential release to the receiving waters. Shell will be contacted when the BMP Plan warrants modification. At a minimum, the BMP Plan will be reviewed prior to adding a new well to the BMP Plan and modified if warranted.

<p><b>AKG-28-8100 – Polar Pioneer</b> <b>January 2015</b></p>	<p>Page 49 of 50</p>
<p><b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b></p>	

Modifications to the BMP Plan must be consistent with the applicable requirements for BMPs in the NPDES GP and 40 CFR 435 for the Alaska Chukchi Sea.

The BMP Plan will be recertified annually (i.e., a new certification page signed by the appropriate authority) if the BMP warrants modification. All modifications will occur within 14 days of an incident or facility change that materially increases the generation of wastes or the potential release to the receiving waters, with the exception of NPDES GP modifications. Modifications triggered by permit modifications will be certified and implemented within three months of the permit issuance.

Shell and the Compliance Specialist will be contacted IMMEDIATELY if the BMP Plan warrants evaluation and possible modification.

At a minimum, the BMP Plan will be reviewed during DWOPs prior to adding a new well to the BMP Plan, and when warranted, the BMP Plan will be modified prior to recertifying the BMP Plan.

#### **14.4 Feedback Records and Continuous Improvement**

All staff involved in the drilling operations at the *Polar Pioneer* will be given the opportunity to further improve the BMP towards the goal of minimized discharge. A standard BMP Feedback Report has been developed (BMP1). Feedback is to be given to the Supervisor on duty and will be kept as a part of the BMP documentation, to be considered during a standard BMP review or sooner if warranted. Questions regarding feedback can be directed to any of the BMP committee members.

Feedback reports are collected in this part of the BMP Plan and must be filed with Shell. They are to be used as guidance for BMP Plan improvement.

#### **14.5 Documentation of Modifications**

All documentation will be kept as a part of the BMP documentation filed at the Compliance Specialists' onboard the rig and after the drilling season with Shell and will be available upon request by the EPA.

<b>AKG-28-8100 – <i>Polar Pioneer</i></b> <b>January 2015</b>	Page 50 of 50
<b>CAUTION: All hardcopies of “Controlling Document” are uncontrolled. When using this document verify that the revision matches the revision in the controlled version found on Livelink®.</b>
